

Use Case

Software Company – BI

▶ **The Customer**

Software companies for Business Intelligence Applications in the international environment, with national companies in Austria, UK and USA.

▶ **The Challenge**

The separately existing legacy systems of the external accountants could not meet the growing requirements of a modern finance solution of the corporate group and had to be replaced by a central and modern ERP tool that would take into account the existing structures, comply with country-specific regulations and enable extensions for integrated corporate processes. In addition, a greater degree of automation was to be achieved, and a stable basis for future extensions established.

▶ **The Solution**

With Oracle NetSuite, the company has found a solution that enables a step-by-step implementation as well as process optimization and the integration of company- and country-specific requirements in a quick and easy way. In addition to master data maintenance, which now requires considerably less administration than before, the reporting possibilities have been taken to a new level. The companies of the individual countries can now be evaluated individually in detail, and with just a few clicks, the company can be viewed as a whole.
